

Figure S2, Fu et al.

Figure S2: Photos of selected *gfp* mutant seedlings (focusing on the hypocotyl region approximately two weeks after germination on solid, sterile MS medium) showing complete or partial losses of fluorescence (top panels) compared to the non-mutagenized *T* line containing the GFP reporter gene (upper right). Images of the same seedlings taken in white light are shown below each fluorescence image. Col is wild-type *Arabidopsis thaliana* ecotype Columbia.
